

In sports, the strongest teams do not wait for the other side to score. They build a defense that prevents problems before they happen. The same is true for your pet's health. Preventive care is your pet's first line of defense against parasites and disease. Heartworm, fleas, and ticks are not just seasonal inconveniences.

### Heartworm Prevention: Your Pets Defensive Line

Heartworm disease is transmitted by mosquitoes and can cause severe damage to the heart and lungs. By the time symptoms appear, the disease may already be advanced.

Monthly prevention acts as a shield, stopping infection before it can take hold. Annual testing ensures your defense is working.

Treatment is expensive and complex. Prevention is simple and effective.

### Flea Protection: Block the Infestation

Fleas multiply quickly and can cause:

- Intense Itching and Skin Infections
- Tapeworm Transmission
- Allergic Reactions
- Household Infestations

Consistent prevention stops fleas and protects both your pet and home.

### Tick Control: Stop Disease at the Source

Ticks carry serious illnesses such as Lyme disease and other tick-borne infections. Many of these diseases can lead to long-term health issues if not addressed early.

#### A Winning Game Plan

Preventive care is not just about parasites. It is part of a comprehensive wellness strategy that may include:

- Routine exams
- Diagnostic screening
- Vaccinations
- Nutritional guidance
